

## problem 2

1. The model focuses on handling the logic of a program and translating that into usable functions that view can use without the need to understand the underlying functions.
2. The view handles visuals and the representation of the model into terms that human users can easily understand and interact with.
3. One of the main benefits is that we can use the same model for multiple views. We could update the view and switch it for another one without the harsh work of reworking our logic.
